

# ClearCorrect™

The clear & simple way to straighten your teeth.

## How does it work?

**Simple.** Just take out your aligners and eat whatever you want, brush and floss normally, then put them back in when you're done. You keep in touch with your doctor, visiting every six weeks or so to make sure your treatment is on track. Each set of aligners moves your teeth just a little bit more until eventually you get straight teeth.

## CASE TYPES

### **Crowding**

Crowded teeth can often make it more difficult to brush & floss effectively, which can lead to tooth decay.

### **Spacing**

Spaced teeth don't support each other as well as normal teeth, so they're more vulnerable to impact and pressure.

### **Overjet**

Over jet refers to the amount of space between your upper teeth and lower teeth. If there's too much or too little space, you won't be able to bite and chew as effectively as you could.

### **Overbite**

Overbite refers to when your upper teeth go way down over your lower teeth. This condition can make it difficult to bite and tear into certain foods.

### **Midline Misalignment**

Minor midline misalignments usually do not significantly impair bite function, but correcting this issue can improve the symmetry and aesthetics of your smile.
